The patient was admitted to our hospital after the explosion accident on 1-1-2011.Alexandria, Egypt

The patient was admitted to the ICU she was shocked and look pale so fluid resuscitation started and blood transfusion started

On admission patient was suffering from:

DLOC, RT shoulder open fracture, RT breast contused wound, LT eye trauma, multiple areas of burn and abrasions in the skin of face and legs, perforating wound in the abdomen, inhalational burn injury .

After admission the following interventions were done to her:

ETT was inserted and she was attached to MV for fear of edema of upper airways then she was weaned when conscious level improved

Orthopedic

Debridement and removal of necrotic tissue for open fracture of the RT shoulder

General surgery

Repair of the contused wound of the RT breast

Exploration of the abdomen was done and a tear in transverse colon was found and repaired

Shrapnel was removed from the colon

Another one was found in the liver the CT scan showed that she it was in segment 5 of liver near the IVC, it couldn't be removed.

Ophthalmology

A CT of LT orbit and US of the LT eye were done showed the following

- Suspected rupture of globe
- Traumatic subluxation of lens
- Subconjunctival he
- Fracture of the floor of orbit with herniation of inferior rectus muscle
- Corneal edema and abrasions
- Contused wound in the LT eye lid which was sutured.
- Intraocular foreign body

Maxilofascial surgeon reviewed the patient and said she needs surgery

1 gm of solumedrol was given for 3 days and then oral prednisolone was given and many eye drops

Plastic surgery

Examined the face and said the small foreign bodies in face can be removed during operation
